VOLUME 38 c

1983

VERLAG DER ZEITSCHRIFT FÜR NATURFORSCHUNG
TÜBINGEN

Contents

Contents of Number 1/2

Original Communications

- A Small-Angle-Scattering Camera without Slithigh-Error, II. (In German)
H. WAWRA 1
- A New Red Dipyrromethene Pigment from *Candida boidinii*
S. LANG, H. BEYER, P. SISTIG, F. WAGNER,
W. TROWITZSCH, and V. WRAY 7
- Ellagitannins from the Leaves of *Vitis vinifera* (In German)
CH. KARL, G. MÜLLER, and P. ALSTED
PEDERSEN 13
- 2-Methoxystyandrone, a New Naphthoquinone from *Rhamnus fallax* B. (In German)
H.-W. RAUWALD and H. MIETHING 17
- Enzymatic Synthesis of Sinapine from 1-O-Sinapoyl- β -D-glucose and Choline by a Cell-Free System from Developing Seeds of Red Radish (*Raphanus sativus* L. var. *sativus*)
D. STRACK, W. KNOGGE, and B. DAHL-
BENDER 21
- Inhibition of Ergosterol Biosynthesis by Etaconazole in *Ustilago maydis*
E. EBERT, J. GAUDIN, W. MUECKE, K. RAM-
STEINER, CH. VOGEL, and H. FUHRER 28
- Isoelectric Focusing of the NAD(P)H-Cytochrome c Reductase Subunit of *Chlamydomonas reinhardtii* Nitrate Reductase
E. FERNÁNDEZ and J. CÁRDENAS 35
- The Effect of Silatranes on Growth, Photosynthetic Oxygen Evolution and Dark Respiration of *Cyclotella cryptica* (Diatomeae) (In German)
R. ROTH, V. P. BARYSHOK, D. I. STOM, D.
WERNER, and M. G. VORONKOV 39
- Oxygen-Evolving Extracts from a Thermophilic Cyanobacterium *Synechococcus* sp.
S. MIYAIRI and G. H. SCHATZ 44
- Synthesis of 2'-/3'-O-Acylated Adenine Nucleotide Analogs and Their Interactions in Photophosphorylation
G. ONUR, G. SCHÄFER, and H. STROTMANN 49
- Studies on the S-State Distribution in *Euglena gracilis*
G. H. SCHMID and P. THIBAUT 60
- Sensitive Fluorimetric Assay for Adenosine Deaminase with Formycin as Substrate; and Substrate and Inhibitor Properties of some Pyrazolopyrimidine and Related Analogues
J. WIERZCHOWSKI and D. SHUGAR 67
- Elucidation of the Different Effects of Polyamines and Other Naturally-Occurring Inhibitors of Cell Proliferation (Chalones) on T-Lymphocyte and Granulocyte Colony Growth *in vitro*
R. MASCHLER, C. J. SMITH, J. C. ALLEN,
and H. R. MAURER 74
- Effect of Organic Solvents on Enzymatic Hydrolysis of Celluloses
M. KUMAKURA and I. KAETSU 79
- Time-Resolved Fluorescence Studies of Hematoporphyrin in Different Solvent Systems
A. ANDREONI, R. CUBEDDU, S. DE SILVESTRI,
G. JORI, P. LAPORTA, and E. REDDI 83
- On the Origin of the Non-Haemic Iron Transferrin ESR Signal: ESR Investigations on Histidine-Iron-Ascorbic Acid Systems
W. LOHMANN, D. HOLZ, B. KIEFER,
and D. SCHMIDT 90
- Coupling of Monomethoxypolyethyleneglycols to Proteins *via* Active Esters
E. BOCCÙ, R. LARGAJOLLI,
and F. M. VERONESE 94
- OH Radical-Induced Main-Chain Scission of Poly-(Ribonucleic Acids) under Anoxic Conditions
K. WASHINO, O. DENK, and W. SCHNABEL 100
- Effect of Streptococcal Extracellular Nuclease on the Carrier Activity of RNA for Streptolysin S
A. TAKETO and Y. TAKETO 107
- DNA Content and Synthesis in Several Tissues and Variation of Moulting Hormone-Level in *Gryllus bimaculatus* DEG (Ensifera, Insecta)
F. ROMER and I. EISENBEIS 112
- Quasielastic Light Scattering of Isolated Chromatin (In German)
B. MEUEL and H. NOTBOHM 126

Physical and Chemical Analyses of the Mineral Substance during the Development of Two Experimental Cutaneous Calcifications in Rats: Topical Calciphylaxis and Topical Calcergy H. J. TOCHON-DANGUY, G. BOIVIN, M. GEOFFROY, C. WALZER, and C. A. BAUD	135	of the Stem Bark of <i>Rhamnus catharticus</i> L.: Emodin-8-O- β -gentiobioside, -glucoside and -primveroside (In German) H.-W. RAUWALD	170
Long Term Cultures of Neural Retina and Pigment Epithelium from Newborn Rabbits T. TSUKAMOTO and H. LUDWIG	141	Isolation and Structure Determination of the Precursors of α - and γ -Irone and Homologous Compounds from <i>Iris pallida</i> and <i>Iris florentina</i> W. KRICK, F.-J. MARNER, and L. JAENICKE	179
<i>Notes</i>		Biosynthesis of 6a-Hydroxypterocarpan: Deuterium NMR Evidence for Direct Hydroxylation of Pterocarpan S. W. BANKS and P. M. DEWICK	185
<i>Ent</i> -Kaurenoic Acid: A Diterpene as Frond Exudate on Ferns of the Genus <i>Notholaena</i> E. WOLLENWEBER, D. MARX, J. FAVRE-BONVIN, and C. BRASSY	146	Chemotypes of <i>Molopospermum peloponnesiacum</i> (L.) Koch (In German) K.-H. KUBECZKA and I. ULLMANN	189
Identification of two Gossypetin Monomethyl Ethers as Yellow Flower Pigments in the Rutaceae J. B. HARBORNE and M. BOARDLEY	148	Fungitoxic Isoflavones from <i>Lupinus albus</i> and other <i>Lupinus</i> Species J. L. INGHAM, S. TAHARA, and J. B. HARBORNE	194
Antimicrobial Activity of N,N'-bis(decylmethyl)- α,ω -alkanediamine Dioxides F. DEVINSKY, I. LACKO, L. KRASNEC, and D. MLYNARČIK	151	An Improved Method of Isolation and Quantitative Determination of Vincalucoblastine from Intact Plants and Tissue Cultures of <i>Catharanthus roseus</i> G. DON. (In German) W. HOFMANN, K.-H. KUBECZKA, and F.-C. CZYGAN	201
Fluorescence Patterns of Chromatin and Cytoplasm by Hematoxylin Solutions J. C. STOCKERT, M. L. MOLERO, and R. H. ESPELOSIN	153	Isolation and Identification of Sterols in the Metabolism of the Fungus <i>Botrytis cinerea</i> (In German) P. FLESCHE, L. GWINNER, S. MÜLLER, and P. SIMON	207
On the Construction of "Optimal" Phylogenetic Trees G. DE SOETE	156	Mechanisms of Inhibition by Mevinolin (MK 803) of Microsome-Bound Radish and of Partially Purified Yeast HMG-CoA Reductase (EC.1.1.1.34) TH. J. BACH and H. K. LICHTENTHALER	212
Contents of Number 3/4		Optically Detected Magnetic Resonance of Porphyrin Complexes in the Bacterium <i>Rhodospseudomonas sphaeroides</i> J. BECK, J. U. VON SCHÜTZ, and H. C. WOLF	220
<i>Original Communications</i>		Affinity of Phycocyanin Chromopeptides to Histidyl-Sepharose Gels: A Model for Histidine-Tetrapyrrol-Interactions in Biliproteins J. RABIER, M. VIJAYALAKSHMI, and W. RÜDIGER	230
Composition and Accumulation of Essential Oil in <i>Matricariae Radix</i> (2. Communication) (In German) J. REICHLING, W. BISSON, H. BECKER, and G. SCHILLING	159		
Flavone C-Glycoside from <i>Metzgeria furcata</i> (Hepaticae) (In German) R. THEODOR, R. MUES, H. D. ZINSMEISTER, and K. R. MARKHAM	165		
A New Investigation on the Composition of <i>Rhamni cathartici</i> Cortex, IV. The Main Anthraglycosides			

Sulfide Stimulation of Light-Induced Hydrogen Evolution by the Cyanobacterium <i>Nostoc muscorum</i> H. WEISSHAAR and P. BÖGER	237	Growth Characteristics of Anaerobically Treated Early and Late S-Period of Ehrlich Ascites Tumor Cells after Reaeration R. MERZ and F. SCHNEIDER	313
Ribulose-1,5-bisphosphate Carboxylase-Oxygenase: New Aspects Respective the pH-Dependence of the Carboxylation Reaction P. BRAUN, J. BODE, and A. WILD	243	Comparative Investigations on Defensive Chemistry and Gland Morphology of Abdominal Defensive Glands from Rove Beetles of the Subtribe Philonthina (Coleoptera, Staphylinidae) (In German) K. DETTNER	319
Evidence for Unequal Misses in Oxygen Flash Yield Sequence in Photosynthesis M.-J. DELRIEU	247	Is the Fly Visual Pigment a Rhodopsin? K. VOGT	329
Calorimeter-Fermentor Combination for Investigations on Microbial Steady State Cultures H. P. LEISEIFER and G. H. SCHLESER	259	<i>Notes</i>	
The 'Double' Michaelis-Menten Equation: Estimation of Parameters A. C. BORSTLAP and P. G. DOUCET	268	The Phytoalexin Response of <i>Lathyrus sativus</i> (Grass Pea) D. J. ROBESON and J. B. HARBORNE	334
L-Usnate-Urease Interactions: Binding Sites for Polymerization B. CIFUENTES, I. GARCÍA, and C. VICENTE	273	Prostaglandin Synthesis Inhibitors Reduce <i>Cannabis</i> and Restraint Stress Induced Increase in Rat Brain Serotonin Concentrations S. K. BHATTACHARYA and D. BHATTACHARYA	337
Enhancement of <i>in-vitro</i> Translation of Eukaryotic RNAs by Cyclic AMP M. E. JOHN and W. KNÖCHEL	277	Erratum to A. ANDREONI, R. CUBEDDU, S. DE SILVESTRI, G. JORI, P. LAPORTA, and E. REDDI (Z. Naturforsch. 38c, 83—89 (1983))	338
Characterisation of the Enzyme Intermediates of the Sarcoplasmic Transport ATPase by the Use of Inhibitors W. BOLL and M. MAKINOSE	282		
Thermal Stability of DNA Interacting with Furozolidone and Cu(II) Ions M. MAITI, S. GHOSH, A. CHATTERJEE, and S. N. CHATTERJEE	290		
Circular Permutation Analysis of Phage T4 DNA by Electron Microscopy G. F. GROSSI, M. F. MACCHIATO, and G. GIALANELLA	294		
On a Quantitative Determination of Antibodies to Lipids and Proteins A. RADUNZ	297		
Effect of Sodium Cholate on the Phase Transition Temperature of Dipalmitoyl Phosphatidylcholine S. BANERJEE and S. N. CHATTERJEE	302		
On the Interaction of Phospholipid Vesicles with Chaotropic Ions TH. PIGOR and R. LAWACZEK	307		
		Contents of Number 5/6	
		<i>Original Communications</i>	
		The Stereochemistry of Silybin (In German) H. LOTTER and H. WAGNER	339
		Identification of Anthocyanins and Intermediates of Anthocyanin Biosynthesis from <i>Petunia hybrida</i> Using High Performance Liquid Chromatography A. W. SCHRAM, L. M. V. JONSSON, and P. DE VLAMING	342
		Formation of Benzophenanthridine Alkaloids by Suspension Cultures of <i>Eschscholtzia californica</i> J. BERLIN, E. FORCHE, V. WRAY, J. HAMMER, and W. HÖSEL	346
		Circular dichroism of C-Phycocyanin: Origin of Optical Activity in Denatured Biliproteins and Evidence for an Intermediate during Unfolding H. LEHNER and H. SCHEER	353

Chromopeptides from Phytochrome and Phycocyanin. NMR Studies of the P _{fr} and P _r Chromophore of Phytochrome and <i>E, Z</i> Isomeric Chromophores of Phycocyanin F. THÜMLER, W. RÜDIGER, E. CMIEL, and S. SCHNEIDER	359	Characteristic Features of the Regulatory Functions of the D-Ribulose 1,5-Bisphosphate Carboxylase/Oxygenase from Spinach J. VATER, T. GAUDSZUN, B. LANGE, N. ERDIN, and J. SALNIKOW	418
Prunasin Biosynthesis by Cell-Free Extracts from Black Cherry (<i>Prunus serotina</i> Ehrh.) Fruits and Leaves J. E. POULTON and SUN-IN SHIN	369	A Cysteine Desulphydrase Specific for D-Cysteine from the Green Alga <i>Chlorella fusca</i> A. SCHMIDT and I. ERDLE	428
Comparison of Purine Metabolism in Suspension Cultured Cells of Different Growth Phases and Stem Tissue of <i>Catharanthus roseus</i> F. HIROSE and H. ASHIHARA	375	Regulation of Nitrogenase Activity in <i>Rhodospseudomonas capsulata</i> AD 2 K. ALEF	436
Uptake and Conversion of Three Different 5-Ring Polycyclic Aromatic Hydrocarbons (PAHs) in Cell Suspension Cultures of Various Chenopodiaceae-Species H. HARMS	382	Nitrate Reductase from a Mutant Strain of <i>Chlamydomonas reinhardtii</i> Incapable of Nitrate Assimilation E. FERNÁNDEZ and J. CÁRDENAS	439
Geranyl Derivatives as Inhibitors of the Carotenogenesis in <i>Synechococcus</i> PCC 6911 (Cyanobacteria) F. JÜTTNER and O. BOGENSCHÜTZ	387	A Membrane Bound Cysteine Oxydase from the Cyanobacterium <i>Synechococcus</i> 6301 A. SCHMIDT and E. KRÄMER	446
Interconversion of Carotenoids and Quinones after Onset of Photosynthesis in Chloroplasts of Higher Plants K. H. GRUMBACH	393	A Specific and Sensitive Radioimmunoassay for Human Choriogonadotropin K. MURALIDHAR, G. CHAUDHURI, J. LIPPES, and O. P. BAHL	451
The Influence of the Glycerol-3-Phosphate Level in the Stroma Space on Lipid Synthesis of Intact Chloroplasts A. SAUER and K.-P. HEISE	399	Effect of Pressure on the Absorption Spectra of Phycobiliprotein and <i>Porphyridium cruentum</i> S. S. BRODY and L. STELZIG	458
Inability of Petite Mutants of Industrial Yeasts to Utilize Various Sugars, and a Comparison with the Ability of the Parent Strains to Ferment the the Same Sugars Microaerophilically J. F. T. SPENCER, D. M. SPENCER, and R. MILLER	405	Bioalkylation of Nucleic Acids in Mice by Insecticides, I. Alkylation of Liver RNA and DNA by Chlorpyrifos I. Y. MOSTAFA, Y. M. ADAM, and S. M. A. D. ZAYED	461
Studies on the Regulatory Role of <i>trans</i> -Cinnamic Acid on the Activity of the Phenylalanine Ammonia-Lyase (PAL) in Suspension Cultures of <i>Daucus carota</i> L. W. NOÉ and H. U. SEITZ	408	Electromagnetic Modulation of Biological Processes: Bicarbonate Effect and Mechanistic Considerations in the Ca-Uptake by Embryonal Chick Tibia <i>in vitro</i> G. COLACICCO and A. A. PILLA	465
<i>Meta</i> -Methylation of Flavonol Rings A(8-) and B(3'-) Is Catalysed by Two Distinct O-Methyltransferases in <i>Lotus corniculatus</i> M. JAY, V. DE LUCA, and R. IBRAHIM	413	Electromagnetic Modulation of Biological Processes: ATPase Function and DNA Production by Raji Cancer Cells <i>in vitro</i> G. COLACICCO and A. A. PILLA	468
		The Influence of the Extracellular Concentration of Calcium, Magnesium and Sodium on the Repo-	

larizing Phase of the Receptor Potential of the <i>Limulus</i> Ventral Nerve Photoreceptor H. STIEVE, M. BRUNS, and H. GAUBE	471	Contents of Number 7/8	
<i>Notes</i>		<i>Original Communications</i>	
Adsorbent Culture — Method for the Enhanced Production of Secondary Substances in Plant Suspension Cultures (In German) B. KNOOP and R. BEIDERBECK	484	Crystal Packing of Odd-Chain Saturated Tri- glycerides D. L. DORSET	511
The Structure of a Ring-A- <i>seco-nor</i> -Triterpenol from <i>Hoya australis</i> Leaf Wax W. J. BAAS	487	New Cembranoids from Tobacco, II A.-M. BYLOV, U. BRÜMMER, W. HASS, F. SEE- HOFER, V. HEEMANN, and V. SINNWELL	515
Studies on the Distribution of Phytosterols in <i>Dioscorea</i> Species Tubers P. G. KADKADE, C. LUJAN, and C. ROLZ	488	3,7,11,15-Cembratetraen-6-ol, a New Cembranoid from Tobacco, III V. HEEMANN, A.-M. BYLOV, U. BRÜMMER, W. HASS, and F. SEEHOFER	517
Quercetin-3- α -L-(2-O- α -L-rhamnopyranosido- arabopyranoside), a New Flavonolglycoside from Seeds of <i>Brassica nigra</i> (L.) Koch. (In German) H. GEIGER, H. MAIER, and K. R. MARKHAM	490	Synthesis of Mono-, Di- and Trigalloyl- β -D-glucose by β -Glucogallin-Dependent Galloyltransferases from Oak Leaves G. G. GROSS	519
Verpacrocin, a Polyene Pigment from Mycelial Cul- tures of <i>Verpa digitaliformis</i> (Pers.) Fr. (Asco- mycetes) (In German) H. BESL, A. BRESINSKY, B. MEIXNER, U. MOCEK, and W. STEGLICH	492	Carboxylic Acids in Wheat, Rye and Barley E. LOHAUS, I. BLOS, and W. RÜDIGER	524
Inheritance of Sesquiterpenoid Phenolic Acid Esters (Guayulins) in F ₁ Hybrids of <i>Parthenium</i> (Asteraceae) H. M. BEHL, B. MARCHAND, and E. RODRIGUEZ	494	Separation, Purification, and Characterization of Two Isoforms of Glutamine Synthetase from <i>Chlamydomonas reinhardtii</i> F. J. FLORENCIO and J. M. VEGA	531
Chemical Composition of the Secretion from the Anal Sacs of <i>Civettictis civetta</i> (Schreber, 1776) J. JACOB and H. SCHLIEMANN	497	Transformations of Phenazines in <i>Pseudomonas</i> <i>aureofaciens</i> (In German) A. RÖMER and E. LANGE	539
The Possible Common Origin of tRNA and 5S rRNA M. UJHELYI	501	Differential Regulation of Flavone Glycosylation during Ontogeny of <i>Silene pratensis</i> J. M. STEYNS, G. VAN NIGTEVECHT, G. J. NIE- MANN, and J. v. BREDERODE	544
Rotation of Cells and Ion Exchange Beads in the MHZ-Frequency Range G. KÜPPERS, B. WENDT, and U. ZIMMERMANN	505	Ontogeny and Biosynthesis of Isovitexin 7-O-Ga- lactoside in a Mutant of <i>Silene pratensis</i> Unable to Glycosylate this Compound in the Petals J. VAN BREDERODE and J. M. STEYNS	549
Temperature Regulation in Wood Ant Nests (<i>Formica polyctena</i> Förster) (In German) K. HORSTMANN	508	Relationship between Flower Development, Antho- cyanin Accumulation and Activity of Enzymes Involved in Flavonoid Biosynthesis in <i>Matthiola</i> <i>incana</i> R. Br. B. DANGELMAYR, G. STOTZ, R. SPRIBILLE, and G. FORKMANN	551

Variable Fluorescence and Fluorescence Spectra of Algae after Herbicide-Induced Pigment Bleaching N. V. KARAPETYAN, R. STRASSER, and P. BÖGER	556	Studies on the Transport of Anions and Zwitterions of Acidic Amino Acids in <i>Streptomyces hydrogenans</i> J. FRITSCH and W. GROSS	617
Investigations on the Synthesis and Biological Significance of Glutamic-1-semialdehyde as a Precursor of the Chlorophylls (In German) H.-U. MEISCH and R. MAUS	563	Hydrogen Bond Indices and Tertiary Structure of Yeast tRNA ^{Phe} M. S. DE GIAMBIAGI, M. GIAMBIAGI, and D. M. S. ESQUIVEL	621
Nitrogen Fixation and Nitrate Respiration by <i>Azospirillum brasilense</i> H. BOTHE, G. BARBOSA, and J. DÖBEREINER	571	Effect of 5'-Terminated (2'-5')-Oligoadenylates on Cap Degrading Activities in Rat Liver Nuclei W. MICHELS and E. SCHLIMME	631
Cyclic AMP Is Not Involved as a Second Messenger in the Response of Soybean to Infection by <i>Phytophthora megasperma</i> f. sp. <i>glycinea</i> M. G. HAHN and H. GRISEBACH	578	Decreased Production of RNA-Streptolysin S in Streptococci Devoid of Extracellular RNase Activity A. TAKETO and Y. TAKETO	635
Biosynthesis of Cyanogenic Glycosides in Butterflies and Moths: Incorporation of Valine and Isoleucine into Linamarin and Lotaustralin by <i>Zygaena</i> and <i>Heliconius</i> Species (Lepidoptera) V. WRAY, R. H. DAVIS, and A. NAHRSTEDT	583	Activation and Inhibition of Na/K-ATPase by Filipin-Cholesterol Complexation. A Correlative Biochemical and Ultrastructural Study on the Microsomal and Purified Enzyme of the Avian Salt Gland D. GASSNER and H. KOMNICK	640
Caffeine-Induced Surface Blebbing and Budding in the Acellular Slime Mold <i>Physarum polycephalum</i> J. KUKULIES, W. STOCKEM, and K. E. WOHLFARTH-BOTTERMANN	589	Incorporation of a Voltage Sensitive Pore from Guinea Pig Heart Mitochondria into Black Lipid Membranes and Characterization of Electrical Properties W. SCHREIBMAYER, H. HAGAUER, and H. A. TRITTHART	664
Regulation of Light Energy Distribution between Photosynthetic Pigment Systems; a Possible Role of Leaf Anatomy G. HARNISCHFEGER and G. ZENK	600	Notes	
Energy Parameters, Macromolecular Synthesis and Cell Cycle Progression of <i>in vitro</i> Grown Ehrlich Ascites Tumor Cells after Inhibition of Oxidative ATP Synthesis by Oligomycin W. KROLL, M. LÖFFLER, and F. SCHNEIDER	604	Flavonoids from the Leaf Resin of <i>Hymenoclea salsola</i> T.&G. (Asteraceae) P. PROKSCH, E. WOLLENWEBER, and E. RODRIGUEZ	668
Embryonic Hemoglobins in Mammals: The Primary Structures of ζ -, ϵ - and δ -Chains of the Pig (<i>Sus scrofa domestica</i>) (In German) F. A. BIEBER, H. ASCHAUER, S. M. BEKTAS, and G. BRAUNITZER	613	New Papaveraceae Alkaloids Including an 7,8-Oxygenated Isoquinoline, the Postulated Precursor of the Cularine Alkaloids G. BLASCHKE and G. SCRIBA	670
		Conical Kinetochores with Single Microtubules in the Micronuclear Mitosis of the Ciliate <i>Colpoda steinii</i> A. KUCK and A. RUTHMANN	672
		Time-Shifted Mating Periods in Two Closely Related Corixid Species J. THEISS	675

Contents of Number 9/10

Z. Naturforsch. **38 c**, 353–358 (1983); received January 17, 1983

Phycocyanin, Phycoerythrin, Phytochrome, Circular dichroism, Denaturation

The circular dichroism spectra (cd) of native and (partially) urea-denatured C-phycocyanin (PC) in the spectral range 700–210 nm are presented. The large ellipticities observed in the chromophoric region of native PC are retained in the fully denatured state (8 M urea). This is similar to the behavior of the red form of phytochrome (P_r), but in contrast to C-phycoerythrin (PE). These differences are rationalized in terms of epimeric equilibria between P- and M-helix shaped chromophores. Depending on the number and location of the chirality centers present in the tetrapyrrol moieties *a priori*, the excess populations of the inherently chiral P- and M-helices differ, thus accounting for large (PC, P_r) or small (PE) ellipticities in the denatured pigments. Hence, the large optical activity observed for the former is generated by an excess population of the P-helix induced by the asymmetric C-2, C-3 and C-3'. In PE the additional chirality center at C-16 counteracts the influence of the others. The excess population of the inherently chiral species is therefore lowered, in agreement with the nearly vanishing cd reported for denatured PE.

The cd has also been studied at intermediate urea concentrations. Unfolding of PC with urea can be interpreted from these data as a stepwise process. Monitoring the urea induced unfolding of PC by cd at different wavelengths ($\lambda = 220, 345, \text{ and } 610 \text{ nm}$); the "melting point" of the apoprotein (4–5 M urea) coincides with the extrema of the titration curves obtained in the chromophore region (345, 610 nm). These results give direct evidence for the existence of an intermediate species whose population reaches a maximum at 4–5 M urea.

Introduction

Phycobiliproteins are light harvesting pigments of certain algae (for some recent reviews, see *e.g.* refs. 1–4).

They contain chromophores like **1** covalently bound to the apoproteins. Whereas the denatured pigments have properties typical to free bile pigments of similar structure, *e.g.* **3**, these properties are conspicuously changed in the native pigments, in an adaptation to their function. From UV-Vis studies and complementary MO-calculations it has been concluded, that these changes are in part due to a conformational transition from a cyclic helical (*e.g.* **1a**) to a more extended conformation (*e.g.* **1b**,

for leading references, see refs. 4), and that this process involves at least one intermediate state [5]. The denaturation of PE [6] and phytochrome P_r and P_{fr} [7] has been studied in detail by a combinatory evaluation of absorption, fluorescence, and circular-dichroism spectroscopy. It could be shown that these techniques are complementary in exhibiting different sensitivities to the processes involved during denaturation. As an example in PE both the fluorescence and the cd-signals of the chromophores [4] decrease to almost zero upon complete unfolding of the protein [6]. On the other hand, the optical activity of phytochrome (P_r , **2**) is retained upon unfolding of the protein [7].

We here wish to report the corresponding cd spectra for the urea-induced denaturation of PC. The results obtained permit conclusions with respect to the origin of optical activity of biliproteins in general, especially in their denatured states. Moreover, more direct evidence has been obtained for a stepwise unfolding of PC proposed earlier from UV-Vis data [5].

Abbreviation: PC, C-phycocyanin; PE, C-phycoerythrin; P_r , red absorbing form of phytochrome; cd, circular dichroism; UV-Vis, absorption spectroscopy in the ultraviolet and visible range.

Experimental part

PC from *Spirulina platensis* was prepared by the method reported earlier [8]. Urea was reagent grade (Merck, Darmstadt) or ultrapure (Schwarz & Mann, New York). In the spectroscopic studies, stock solutions of PC ($\approx 20 \mu\text{M}$) in potassium phosphate buffer (0.05 M, pH 7) were mixed with this buffer, and with buffer containing urea (8 M) in the appropriate ratios. UV-Vis and fluorescence spectra were recorded on a model DMR22 (Zeiss, Oberkochen) spectrometer equipped with thermostated cell holder, at 20 °C. Cd-spectra were recorded on a dichrograph Mark III (Jobin-Yvon, France) using thermostated (20 ± 1 °C) cylindrical quartz cuvettes with variable path length (10–0.1 mm). The base lines were obtained by measuring the appropriate buffer-urea solutions under the same conditions.

Results

The cd of native PC (Fig. 1) has a positive long-wavelength band peaking at 632 nm and a negative near-uv cd-band peaking at 342 nm, which are due to the chromophores. The bands below 280 nm arise primarily from the apoprotein. Both chromophore

bands are structured in a similar fashion as the absorption bands (Fig. 1), although there are small but distinct variations between the cd- and UV-Vis maxima (*vide infra*).

PC contains three chromophores of identical molecular structure (**1**), but in different protein environments (see refs. 1–4). The fine structure of

Fig. 1. Cd (—) and UV-Vis absorption spectrum (-----) of PC (4×10^{-6} M) in the chromophoric region in phosphate buffer (0.05 M, pH 7) at room temperature. Molar extinction coefficients (ϵ) and $\Delta\epsilon$ -values are given for the monomer containing three chromophores.

the long-wavelength cd-band is roughly similar to that of the absorption band. In the latter, the major band corresponds to two chromophores, one each on the α - and β -chain. The shoulder at shorter wavelengths which is resolved as a second band at low temperatures [9] arises from the second chromophore on the β -chain. This assignment is likely from the spectra of the isolated subunits (Scheer *et al.*, unpublished). The similarity of the cd-band shape to this pattern indicates a similar differentiation. Upon denaturation, the long-wavelength cd-band ($\lambda_{\max} = 615 \text{ nm}$) exerts a hypsochromic shift by

Fig. 2. Cd (—) and UV-Vis absorption spectrum (-----) of PC ($4 \times 10^{-6} \text{ M}$) in phosphate buffer (0.05 M, pH 7) containing urea (8 M) at room temperature. See Fig. 1 for molar extinction coefficients and $\Delta\epsilon$ -values.

Fig. 3. Cd (—) and UV-Vis absorption spectrum (-----) of PC ($4 \times 10^{-6} \text{ M}$) in aqueous urea (8 M) titrated with HCl to pH 1.5, at room temperature. See Fig. 1 for molar extinction coefficients and $\Delta\epsilon$ -values.

Fig. 4. Cd spectra of PC ($4 \times 10^{-6} \text{ M}$) in the peptide absorption region at various urea concentrations (0 M, 2 M, 3 M, 4 M, 5 M, 6 M, and 8 M) in 0.05 M phosphate buffer at pH 7; room temperature.

17 nm, and the $\Delta\epsilon$ -value is decreased only by about 40% (Fig. 2). The changes in the negative band at 342 nm are less pronounced, there is even a slight increase of the ellipticities. Both bands lose their fine structure with increasing urea concentrations.

For a comparison, the cd of PC in 8 M urea at pH 1.5 is given in Fig. 3. The chromophore is present in its protonated form under these conditions. In the UV-Vis spectrum, this leads to an increased absorption and a concomitant red-shift of the long-wavelength band [10], whereas the near-uv band remains almost unchanged. The red-shift is matched by the cd-band. The anisotropy factor of both bands is decreased by a factor of two.

The region of the peptide cd-bands (200–250 nm) shows a steady decrease with increasing urea concentrations (Figs. 4, 5), with an inflection at about 4.5 M urea. The cd-titration curves at wavelengths $\geq 300 \text{ nm}$ (corresponding to chromophore absorptions) do not show similarly steady changes but rather irregularities which are most pronounced in the region between 4 and 5 M urea. Two such curves are shown in Fig. 5, and phenomenologically similar curves are obtained at any other wavelength corresponding to chromophore rather than peptide absorptions.

Fig. 5. Titration curves of PC with urea at three wavelengths: a: 220, b: 345 and c: 610 nm, monitored by cd.

Discussion

a. Noncoincidences between cd- and UV-Vis absorption extrema

Whereas the cd fine structure in the native pigment can be interpreted like the electron absorption spectra by the three chromophores present in different environments (see refs. 1–4), the bathochromic shift of the cd-spectra with respect to the electron absorption spectra in the chromophoric region needs further discussion.

Principally, it may arise from several origins: i) A dynamic equilibrium between different conformers of each chromophore, with the populations absorbing more to the red exhibiting a stronger optical activity. ii) Each of the three chromophores is in a rather distinct environment, but the one absorbing mostly to the red has a proportionally low absorption and high optical activity. This situation is similar to (i), but represents a frozen rather than a

dynamic state. iii) At least two of the chromophores are close enough and appropriately oriented to each other to produce an exciton couplet with a positive band at the long-wavelength side.

Whereas several lines of evidence (see ref. 4) render the possibility (i) unlikely, both (ii) and (iii) are compatible with results assigning each chromophore type to a rather distinct and rigid site. Exciton coupling (e.g. iii) seems at least possible from the following arguments: In native PC the long-wavelength cd-maximum occurs at 632 nm, which is shifted by 306 cm^{-1} (12 nm) to the red as compared to the long-wavelength absorption maximum. A corresponding negative extremum would be expected around 608 nm. The pronounced dip in the cd-curve at 602 nm is indicative of this and may arise from a superposition of the negative part of the couplet with the positive band due to the "s"-chromophore. The opposite changes around 630 (negative) and 600 nm (positive) upon denaturation would also support this explanation. Exciton splittings have earlier been proposed for a cryptophytan PC [11] and several allophycocyanins [12], and also discussed for PE [6], but only in the former case there exists more than circumstantial evidence.

b) Origin of optical activity in native and denatured biliproteins

The spectral properties and the conformation of the prosthetic groups of native biliproteins are strongly influenced by the corresponding apoproteins to which they are covalently bound. Thus, the chromophores exhibit an extended conformation which is chiral and rigid due to non covalent interactions with the apoprotein. On destroying the influence of the apoprotein by denaturation with urea, the conformation of the tetrapyrrol chromophores changes to a cyclic, helical arrangement (see ref. 4 for leading references). Hence, denatured biliprotein-chromophores predominantly adopt a cyclic helical conformation (2a and 1a respectively). In open-chain tetrapyrrols lacking any chiral influence the P- and M-helices are enantiomeric and thus equipopulated. Since the inversion barrier of the tetrapyrrol-helix is low ($42\text{ kJ} \cdot \text{mol}^{-1}$ in biliverdin [13]) and inversion fast at ambient temperature, the P/M-helix ratio can be changed by exerting a diastereoisomeric relationship on it. Since such

helices represent inherently chiral chromophores large optical activity is to be expected even if the excess population is small. An example for an external chiral influence represents the cd of achiral bile pigments complexed with the protein, serum albumin [14] or dissolved in chiral, optically active solvents [15–17].

In the denatured state of biliproteins the optical activity observed, is governed mainly by internal chiral influences, viz. of the chirality centers present in the chromophores. The PC chromophores possess chirality centers at C-2, C-3 and C-3¹ inducing a twist of the C-5 methine bridge, which is energetically favoured in one distinct direction. Hence, the large optical activity of even denatured PC may be rationalized in terms of an excess population of the P-helical arrangement being diastereoisomeric to the less populated M-helix. This interpretation is further corroborated by recent Ramachandran-type calculations [18, 19] indicating a twist of the C-5 methine bridge due to steric hindrance of the asymmetrically substituted ring A with rings B and D. Accordingly, the P-helical form would be favoured, in agreement with both the sign and the strong optical activity of denatured PC.

This interpretation likewise accounts for both the low optical activity observed for denatured PE (chromophore **4**) [6] and the large $\Delta\epsilon$ -values reported for denatured red-absorbing phytochrome (P_r , chromophore **2**) [7]. The chromophores of P_r (**2**) and PC (**1**) are constitutionally and configurationally closely related. The reason for the high optical activity in the denatured state of P_r may then likewise be attributed to the influence of the chirality centers at C-2, C-3 and C-3¹, in generating an excess population of the P-type tetra-pyrrolo-helix. In PE (**4**), the additional chirality center at C-16 leads to a perturbation at the C-15 methine bridge as well. However, this influence counteracts the one exerted by C-2, C-3 and C-3¹. In a situation similar to that in the i(=inactive)-urobilins with asymmetric C-4 and C-16 [20] these opposing effects in PE account for the extremely low optical activity observed for denatured PE [6].

For a more relevant comparison of PC with P_r we have also measured a cd-spectrum of the urea-unfolded PC under acidic conditions (Fig. 3). The cd-spectrum of protonated PC (Fig. 3) possesses the same phenotype as that of protonated P_r . It is positive in the long wavelength band, negative in the

band around 360 nm. Even the $\Delta\epsilon$ -values are very similar: P_r : 660 nm, $\Delta\epsilon = +20$; 375 nm, $\Delta\epsilon = -15$; PC (values for *one* chromophore): 658 nm, $\Delta\epsilon = +101/3 = +33$; 350 nm, $\Delta\epsilon = -75/3 = -25$. In the native state, by contrast, the cd-spectra of phytochrome P_r [7] and of PC (Fig. 1) are (expectedly) quite different indicating the varying influence of the two different proteins on the chromophores.

The close resemblance of the cd-spectra of the denatured PC (Fig. 2, 3) and phytochrome in the P_r -form [7] with that of a model pigment, 2,3-dihydrooctaethylbilindion (**3**), in chiral, optically active solvents [17] further corroborates the arguments made above. The cd-maxima of the latter at 610/348 nm [17] are only slightly shifted as compared to denatured PC at 615/358 nm (Fig. 2). Moreover, the similar ratios of $\Delta\epsilon$ -values (0.7 for dihydrooctaethylbilindion **3** and 0.8 for PC in 8 M urea) indicate a similar pitch for the helix of the two chromophores.

c. Stepwise unfolding of PC during denaturation

In an earlier study of PC unfolding [5] an intermediate during the denaturation process of PC with urea has been postulated to account for the singular behavior of the UV-Vis absorption spectra. Fig. 5 nicely shows that the cd-titration curves yield more direct evidence for this assumption. The titration curve of the apoprotein ($\lambda = 220$ nm, curve **a** in Fig. 5) taken from the data of Fig. 4 has an inflection point between 4 M and 5 M urea. This point roughly represents the “melting point” of the apoprotein of PC. However, monitoring the chromophoric region by cd, e.g. at 380 nm and 610 nm (curves **b** and **c** in Fig. 5), curves are obtained whose maxima approximately coincide with the inflection point of curve **a** for the peptide region (arrows). In a mathematical sense, curves **b** and **c** are derivatives of **a**. This means, that at least three species of PC are involved in the denaturation process: Between 0 M and 2 M urea the native species dominates. With increasing urea concentration, the concentration of this species decreases and an intermediate, new species appears reaching a maximum at the “melting point” of the apoprotein (4 M–5 M urea). Higher urea concentrations then favour the completely randomized, denatured PC and the concentration of the intermediate vanishes again at 8 M urea.
